

CREATE Education is a company aimed at teaching digital skills to students which are urgently needed for the businesses in Baden- Württemberg. The company provides 3D-CAD-workshops – basic and advanced- that cover the entire development process, from the idea generation to the creation of the additively manufactured product.

Main focus are students who want to get creative and learn new skills in Additive Manufacturing, schools and companies interested in young talents and in staying up to date with innovative technologies. The 3D-CAD-workshops are sometimes held in the training departments of the involved companies, while meeting with regional companies and educational mentors is also provided during online courses and in person.

Lessons learned and hints for implementation:

- schools are established systems; it will require lots of effort to integrate the workshops within their programs;
- companies are hard to convince to invest in something that does not pay off immediately: tangible outputs of previous editions helps doing that.
